## ABSTRACT

A support assembly for a ground-engaging component of a vehicle which includes a base section, a column which is mounted for movement relative to the base section between a traveling position and a storage position, and a locking assembly for holding the column. The locking assembly is capable of locking the column in the traveling position or in a storage position. The assembly also includes an actuator which, when the column is in the traveling position, is movable from a rest position along a release path to initiate a release of the locking assembly, and thereby allow the column to be moved from the traveling position to the storage position.
